

Startup Investment Analysis – Shark Tank India

Abstract

This project analyzes startup funding trends using the Shark Tank India dataset. The study evaluates deal success rates, negotiation intensity, valuation adjustments, and shark participation patterns using structured data analysis.

Introduction

The dataset contains pitch-level financial details including ask amount, equity requested, valuation expectations, final deal metrics, and shark participation indicators. The objective is to uncover measurable patterns influencing funding outcomes.

Tools Used

- Python (Pandas for data manipulation)
- Matplotlib for visualization
- Jupyter Notebook for analysis workflow
- Microsoft Excel for validation
- ReportLab for PDF generation

Steps Involved in Building the Project

- Loaded and explored the dataset using Pandas.
- Validated numeric financial columns.
- Calculated deal success rate.
- Compared ask vs deal metrics.
- Analyzed shark participation trends.
- Generated visual insights and summarized findings.

Key Visual Insights

Conclusion

The analysis demonstrates that negotiation significantly impacts funding outcomes. Successful deals typically involve valuation adjustments and increased equity allocation. Multi-shark participation is associated with higher deal amounts, indicating collaborative investment strategies.
